AND
TRIBUTARIES
WATERWAYS ACTION
PLAN**

**MISSOURI RIVER ANNEX
2017**

MISSOURI RIVER ANNEX

Introduction

This appendix provides general information and target gages to be used as a guideline for a crisis on the Missouri River. Like a crisis on the Upper Mississippi River (UMR), it is the responsibility of the United States Coast Guard (USCG), Army Corps of Engineers (USACE), and River Industry representatives to meet and discuss conditions on the Missouri River and to *annually* review the actions specified in the plan. *This annex will normally be reviewed in conjunction with the winter navigation meeting.* In Section 4 of this annex, the Missouri River has Action Plan Tables for High Water, Low Water and High Current. An Action Plan Table for ice conditions is not included as navigation does not normally occur during the ice period mid December to mid March of each year. The tables are divided by river reaches with three action phases (e.g., *Watch, Action, and Recovery Phases*) described in the plan. Support tables of historical river flow discharges and river stage references, including recommended close and open watch stages, are included.

Section 1 – Geographic Description

The Missouri River Basin drains 529,000 square miles, including about 9,700 square miles located in Canada. The basin spans 10 states, including all of Nebraska, most of Montana, Wyoming, North Dakota, and South Dakota; about half of Kansas and Missouri; and smaller parts of Iowa, Colorado, and Minnesota. The Missouri is fed from several major tributaries, the Yellowstone, Platte, Kansas, Grand, and Osage Rivers.

The Missouri River extends 2,619 miles from its utmost source at Browers Spring on Hell Roaring Creek and 2,321 miles from Three Forks, Montana where the Jefferson, Madison, and Gallatin Rivers converge. The Missouri River is the longest river in the United States, draining one sixth of the country. The Missouri River Mainstem System (System) consists of six dams and reservoirs on the Missouri River located in Montana, North Dakota, South Dakota, and Nebraska. The six are Ft. Peck Dam in Montana, Garrison Dam in North Dakota, Oahe Dam, Big Bend Dam and Ft. Randall Dam in South Dakota and Gavins Point Dam in South Dakota and Nebraska. The System has a capacity to store 73.1 million acre-ft of water, which makes it the largest reservoir system in North America. The USACE regulates the System to serve the congressionally authorized project purposes of flood control, navigation, irrigation, hydropower, water supply, water quality, recreation, and fish and wildlife. The USACE considers all of the congressionally authorized project purposes when making decisions to optimize the development and utilization of the water resources of the Missouri River Basin to best serve the needs of the people. The System is regulated as a hydraulically and electrically integrated system. Runoff from above the System is stored in the six reservoirs. Water is released from the System as needed for downstream flow support. Released water from the lowest dam in the System, Gavins Point Dam, flows down the Missouri River, which includes the Bank Stabilization and Navigation Project from Sioux City, Iowa to the mouth near St. Louis, Missouri.

The Missouri River Bank Stabilization and Navigation Project was first authorized in 1912 with six subsequent authorizations that changed channel dimensions and extended channel reaches. The most recent authorization was by the March 2, 1945 Rivers and Harbors Act. This act authorized a 9 foot deep by minimum 300 foot wide navigation channel from Sioux City, Iowa to the mouth. The 734.8 mile navigation channel is continuous and free flowing without the use of locks or dams. A sinuous course of reverse bends and controlled river width was managed by constructing rock or piling structures called dikes and revetments. Dikes were constructed perpendicular to the flow and revetments were constructed parallel to the flow. This arrangement manages the constant movement of sediment to minimize channel shoaling providing a consistent and reliable navigation channel without the need for maintenance dredging.

Acronym List for Upper Missouri River Annex

USACE = ARMY CORPS OF ENGINEERS
AWO = AMERICAN WATERWAYS OPERATORS
BNM = BROADCAST NOTICE TO MARINERS
CFS = CUBIC FEET PER SECOND
CRP = CONSTRUCTION REFERENCE PLANE
DWB = DISTRICT WESTERN BRIDGES
ICP = INCIDENT COMMAND POST
JIC = JOINT INFORMATION CENTER
MOR = MISSOURI RIVER
MRAC = MISSOURI RIVER ACTION COMMITTEE
NOAA = NATIONAL OCEANIC ATMOSPHERIC ADMINISTRATION
NWO = USACE OMAHA DISTRICT
NWD = USACE NORTHWESTERN DIVISION
NWK = USACE KANSAS CITY DISTRICT
NWS = NATIONAL WEATHER SERVICE
O&M = OPERATION AND MAINTENANCE
PMV = PERMANENTLY MOORED VESSEL
RIAC = RIVER INDUSTRY ACTION COMMITTEE
RIBB = RIVER INFORMATION BULLETIN BOARD
RM = RIVER MILE
UMIB = URGENT MARINE INFORMATION BROADCAST
UMR = UPPER MISSISSIPPI RIVER
USCG = UNITED STATES COAST GUARD
USGS = UNITED STATES GEOLOGICAL SURVEY
WAP = WATERWAYS ACTION PLAN

Section 2 – Parties and Roles

U.S. Coast Guard (USCG)

The USCG Sector Commander Upper Mississippi River, with its principal office in St Louis, MO is responsible for safety of navigation, security, and law enforcement along the Missouri River. The USCG Sector Upper Mississippi River Prevention Department, Waterways Branch, using the cutters Gasconade, stationed in Omaha, and the Cheyenne, stationed in St. Louis, is responsible for maintaining and setting buoys and shore aids along the Missouri River. The Prevention Department also focuses on licensed mariners issues, permits, casualty investigations, and security verifications. The USCG Sector Upper Mississippi River Response Department uses USCG small boats, other law enforcement partnerships and first responders to patrol and respond to emergencies or incidents on the Missouri River.

U.S. Army Corps of Engineers (USACE)

The day to day operation and maintenance (O&M) for the Missouri River Bank Stabilization and Navigation Project, Sioux City, IA to the Mouth is managed by two river field offices. The Missouri River Project Office, located in north Omaha, at river mile 627.0, is responsible for the O&M from Sioux City, Iowa to Rulo, Nebraska. The Missouri River Area Office, located at Napoleon, Missouri, at river mile 328.7, is responsible for the O&M from Rulo to the mouth and has a satellite floating plant facility at Gasconade Harbor at river mile 104.5. These offices report to Omaha District (NWO) and Kansas City District (NWK) respectively. NWO and NWK report to the Northwestern Division (NWD), Portland, Oregon. There is a Division Regional Office in Omaha, Nebraska that provides the day to day support for both Districts concerning the Missouri River. NWK and NWO have Water Management functions for the regulation of tributary dams in the Missouri River basin dividing their responsibilities at Rulo, Nebraska. The NWD Missouri River Basin Regional Office located in Omaha has the Water Management responsibilities for the Missouri River Mainstem System and coordinating responsibilities on tributary reservoir regulation.

U.S. Coast Guard District Eight Bridge Branch (DWB)

The Bridge Administration Program has a mandated responsibility to protect the public right of navigation. Activities include determining location of navigation channel piers and issuing bridge permits. They establish, revise and monitor drawbridge regulations and prescribe bridge lighting. Also, Truman-Hobbs studies of unreasonable obstructive bridges are conducted on a nationwide basis.

RIAC & MRAC

The River Industry Action Committee (RIAC) is an association of companies and organizations, who are stakeholders in the commercial industry on the inland rivers, however are more focused on the Mississippi, Ohio and Illinois Rivers. As the name suggests, they act in an advisory capacity on a wide range of issues affecting the activities of the industry on the rivers. They provide an industry perspective to the USCG and the USACE on matters such as high and low water, ice conditions, shoaling, marine accidents, etc. During 2008 the Missouri River navigation stakeholders formed the Missouri River Action Committee (MRAC) to function in a similar way as RIAC to provide industry representation with the USACE and USCG to interact and coordinate emergency responses.

Missouri River Ice Team (MRIT)

The Missouri River Ice Team is made up of private and industry volunteers who make regular observations and reports to the USACE on the ice conditions of the Missouri River during winter operations. These observations are reported to the basin. Although the Missouri River navigation industry avoids operating during ice conditions on the Missouri River, they often use the information to enter the river in the spring early in advance of reservoir support or leave the river late in the fall after the end of reservoir support. They will do this if during those years the reservoir system is releasing flood storage or tributary conditions provide adequate navigation flows. Reservoir flow support for navigation under normal conditions is from April 1 to December 1. This period is outside the normal ice buildup.

Designated Waterfront Facilities

The commercial interests of the designated waterfront facilities are directly impacted by navigation conditions on the Missouri River, and any actions taken by the USCG or USACE of Engineers in response to hazardous conditions that develop on the river. These facilities can play a valuable role in providing feedback to other parties on both river conditions and impact of proposed actions of the USCG and USACE.

State Emergency Managers

Hazardous conditions on the Missouri River, particularly high water/flooding conditions, frequently involve state emergency managers, as they become involved in responding to affected communities, and take a direct interest in conditions or activities that can affect the levee systems that protect those communities. State emergency management offices coordinate state, private and federal support to local and tribal governments. It's important to provide timely risk assessment information and incident briefings to the state emergency management offices. Risk assessments and incident briefings will then be shared by the appropriate state emergency management office with local/tribal emergency managers and other appropriate agencies through Situation Reports and other forms of notification. Requests for assistance by a local/tribal government must be coordinated through state emergency management. Emergency contact information follows.

USACE POSITION Kansas City District RM 498.4 – 0.0	DUTIES & RESPONSIBILITIES	EQUALS	USCG POSITION	DUTIES & RESPONSIBILITIES
Assistant Area Engineer, Missouri River Area Office, Napoleon, MO	Day to day O&M Missouri River, Rulo, NE to the mouth		Sector Upper Mississippi River Chief of Waterways	Manages daily waterway management and casualty operations
Area Engineer, Missouri River Area Office, Napoleon, MO	Supervises Missouri River Area Office		Sector Upper Mississippi River Chief of Waterways	Manages daily waterway management and casualty operations
Chief of Operations, Kansas City District	Supervises Operations Manager		Sector Upper Mississippi River Chief of Prevention	Supervises operational issues
Chief, Water Control for Tributaries	Supports Chief of Operations		Sector Upper Mississippi River Chief of Waterways	Manages daily waterway management and casualty operations
Chief, Reservoir Control Center Northwestern Div	Coordinates with Chief of Water Control & Supports Division Commander		Sector Upper Mississippi River Chief of Prevention	Coordinates with Chief of Waterways & Supports Sector Commander
District Commander Kansas City District	Supervises Chief of Operations		Commander Sector Upper Mississippi River	Senior USCG officer in area
Division Commander Northwestern Division	Supervises District Commander		Commander USCG Eighth District - D8	Senior USCG officer in District

USACE POSITION Omaha District RM 734.8 – 498.4	DUTIES & RESPONSIBILITIES	EQUALS	USCG POSITION	DUTIES & RESPONSIBILITIES
River Foreman, Missouri River Project Office, Omaha, NE	Day to day O&M Missouri River, Sioux City, IA to Rulo, NE		Sector Upper Mississippi River Chief of Waterways	Manages daily waterway management and casualty operations
Operations Manager, Missouri River Project Office, Omaha, NE	Day to day O&M Missouri River, Sioux City, IA to Rulo, NE		Sector Upper Mississippi River Chief of Waterways	Manages daily waterway management and casualty operations

District Commander Omaha District	Supervises Chief of Operations		Commander Sector Upper Mississippi River	Senior USCG officer in area
Division Commander Northwestern Division	Supervises District Commander		Commander USCG Eighth District - D8	Senior USCG officer in District

Section 3 - Communications

Initiation of Communications Plan- This section provides guidance on the methods of communicating and receiving information. The Coast Guard, USACE and maritime industry carefully monitor river conditions and levels. When any of the conditions warrant attention, (high water, low water, high flow, ice or any other hazardous condition), any UMR stakeholder can request a conference call by contacting either the USCG Sector Chief of Waterways UMR, the USACE, or the Chair of RIAC and/or IRCA. If further discussion is needed the members listed on the following pages of this section to include Industry, and State personnel will be contacted via email or phone call. The RIAC and/or IRCA chairs will contact those members of their respective organizations. From there, if appropriate, a teleconference will be set up to confer with all parties on possible measures to take and joint courses of action using the guidance from this annex as a basis to make a determination. By conferring frequently with all UMR stakeholders a joint action plan to safely navigate during the condition that warranted initiating the communications plan will be developed. The action plan will then be communicated to all UMR stakeholders using Broadcast Notice to Mariners, SUMR Homeport at <https://homeport.uscg.mil> and Local Notice to Mariners.

In the event of an unexpected river closure, the following steps will be considered to reopen the river: Conduct test tows if necessary for potential problem areas. Develop and initiate recovery plan to clear the queue. Issue advisory or establish safety zone if deemed necessary that indicates extreme low water, high water, or high current. USCG will reset buoys in those narrow channel locations within reach. USACE will continue increased level of channel reconnaissance. Consider draft limits, tow sizes, and helper boats. Evaluate fleet dimensions. Be aware of shifting channels, emergency dredging may be required at some locations. Consider restrictions on single skin barge movement. Continue communications (e-mails, conference calls or others) – consider establishing notices, advisories and/or safety zones as needed using standard communication links between USACE, USCG and Industry.

Phone Conference Call Agenda:

- I. Roll Call by Phone Conference Host
- II. Protocol for Conference Call
- III. Open Statement by Chairman or Co-Chairman of RIAC on Issues
- IV. Weather Forecast by NWS or USACE
- V. River Stage Forecast by USACE
- VI. Channel Report for Area Of Concern by USACE
- VII. Status of Dredging and Next Scheduled Locations
- VIII. USCG Report on Advisories and Remarks
- IX. USCG Buoy Tender Report on Channel Conditions
- X. River Condition Report and Issues of Conference Call by Industry
- XI. Discussion of Issues on Current Situations
- XII. Assessment, Actions to Be Taken
- XIII. Closing

All Agencies & Organizations

To ensure effective interagency cooperation during periods of coordinated response to rising water, falling water, very high current or other hazardous river conditions, stakeholder organizations are advised to **maintain active and ongoing communications with one another during normal river conditions and while planning together for joint response activities**. This will greatly facilitate speedy and effective communications under the pressure of responding to an event. These communications will be facilitated by the contact listing on the following pages of this section. As an aid to those looking to better understand USCG and USACE internal notification procedures, a description of these procedures is provided in paragraph “Notifications” that follows.

Vessel to Vessel and Vessel to Shore Communications

VHF communications on the Missouri River are handled by the communications center at USCG Sector Upper Mississippi River in St. Louis, MO. Primary contact is made on channel 16 then; generally, you will be instructed to switch to another channel to continue discussion.

Notifications

U. S. Coast Guard

The USCG maintains a 24 x 7 live watch at Sector Upper Mississippi River Command Center in St. Louis, MO. Hazardous river conditions are monitored by Sector personnel and reported as appropriate to the Commander, Sector Upper Mississippi River. As conditions dictate, the Commander, Sector Upper Mississippi River, will release Broadcast Notices to Mariners (BNM) or Urgent Marine Information Broadcasts (UMIB) with safety advisories, safety zones, or river closures. This information will also be posted on the SECUMR Homeport. As noted above, these waterways control measures are determined in consultation with the USACE and representative of the river industry.

Sector Upper Mississippi River Contact: 314-269-2500

Sector 24 Hour Contact Numbers: 314-269-2332 or 314-269-2463

Corps of Engineers

During Normal Work Hours

During periods of hazardous river conditions the USACE field offices work closely with river users and the basin river communities. The field office staff reports the river conditions and impacts to their respective District Office and NWD Point of Contact. The USACE has two district offices responsible for the Missouri River; the Omaha District and the Kansas City District. The District boundaries split at Rulo, Nebraska (RM 498.4). The field staff report to district staff persons within Operations Division and Emergency Management Division. Operations Division staff will inform the District Water Control or Water Management Offices, the district leadership and the District Commander. They will also notify Division Water Management. They will then contact appropriate staff person in the Division Office, who will notify, the appropriate Division leadership and the Division Commander. The District Operations staff will coordinate with the USCG throughout the hazardous period. When river conditions become too hazardous for safe navigation or if continuing navigation causes an unsafe condition such as causing levee erosion or interfering with flood fighting, etc, the USACE through the

appropriate District Commander will make recommendations to the USCG to issue safety zone restrictions or river closures. Likewise as river conditions improve the USACE through the appropriate District Commander will make recommendations to the USCG to remove the safety zone restrictions or reopen the river to navigation.

After Normal Work Hours, Weekends and Holidays

Any USACE staff person, field office, District or Division who becomes knowledgeable of a hazardous river condition will contact the Kansas City District or Omaha District Emergency Management Office 24 hour phone number. Here the most up-to-date contact list with home and cell phone numbers are maintained of USACE staff responsible for emergency response to hazardous river conditions.

Kansas City Emergency Management Office:	Jud Kneuvean (816) 426-6320
Omaha District Emergency Management Office:	Matthew Krajewski (402) 995-2448

Iowa Homeland Security & Emergency Management Department (HSEMD)

HLSEM is responsible for coordinating emergency preparedness activities across the State of Iowa. Iowa Homeland Security supports asset protection initiatives and promotes security awareness among all citizens. When an emergency of state or regional significance occurs, HLSEM coordinates response and recovery assistance. HLSEM engage all state response capabilities and facilitate emergency aid across local and state political boundaries. When it is needed, HLSEM is responsible for requesting and coordinating assistance from partner states and the federal government.

HLSEM believes that productive information sharing relationships are critical to homeland security and emergency preparedness. When information concerning the safety and security of Iowa's citizens and communities becomes available, please contact the HLSEM Duty Officer at 515-979-2200 or 515-725-3231. The Duty Officer can put you in contact with Operations Officer (MARSEC POC), or Chief of Operations.

Missouri State Emergency Management Agency

The Missouri State Emergency Management Agency (SEMA) coordinates and develops the State Emergency Operations Plan, oversees Missouri's disaster preparedness, floodplain management, hazard mitigation and public assistance programs as well as coordinates the state's response operations for all types of large-scale emergencies anywhere in the state.

SEMA and the State Emergency Operations Center (SEOC) are located at the Missouri Army National Guard Ike Skelton Training Site, east of Jefferson City. SEMA has a state-of-the-art facility and technical equipment to direct Missouri's disaster emergency response and recovery operations. The SEOC enables all state agencies to come together during an emergency, gather information from local jurisdictions and quickly respond to the disaster. The EOC has fully functional workstations, access to communication resources that include radio, telephone, satellite and wireless computer links.

The State EOC is designed to support 24/7 operations with kitchen facilities, showers, security, and lodging capability. The Missouri Information Analysis Center is located directly adjacent to SEMA offices and is an integral part of Missouri's response team.

SEMA has direct coordination and support for local emergency managers through nine area coordinators, one assigned to each region of the state. These SEMA employees have vehicles equipped with the latest in radio, satellite and mobile data terminal technology, most recently used during a dam failure in rural Missouri.

SEMA has a 24-hour duty officer who can be reached at (573) 751-2748; SEMA's agency toll-free number is (800) 298-6289.

SEMA's Director is Mr. Ron Walker and Deputy Director is Ms. Dawn Warren.

Nebraska State Emergency Management Agency

The State Emergency Management Agency mission is to provide for the coordination and implementation of measures and procedures designed to meet the danger to the citizens and communities of Nebraska caused by natural, man-made or technological disasters, civil disturbances, or hostile military or paramilitary action. To prepare for a prompt and efficient response protects lives and prevents the loss of property from all hazards. To ensure that the public is served in a timely and efficient manner, to provide for effective utilization of resources to support local political subdivisions in disaster recovery activities and to establish and implement a management system for coordinating State agencies', Federal agencies', private and non-governmental agencies' respond using the multi-agency coordination structure in the National Response Plan (NRP) and in accordance with the National Incident Management System (NIMS). The Nebraska State Emergency Management Agency can be contacted 24 hours a day all year at 402-471-7421.

North Dakota Department of Emergency Services

The N.D. Department of Emergency Services (NDDDES), comprised of the Divisions of Homeland Security and State Radio, provides 24/7 emergency communications and resource coordination with more than 50 lead and support agencies, private enterprise and voluntary organizations to assist local jurisdictions in disaster and emergency response activities. Each community maintains a direct responsibility for the safety of its citizens. Local and tribal governments provide initial response to incidents, emergencies, disasters or catastrophes. Local Emergency Managers serve a key role in coordinating response and recovery efforts and offer a better understanding of the situation and accompanying resource requirements. NDDDES supports response and recovery coordination with Emergency Managers in each county and tribal nation within the state of North Dakota as well as the cities of Bismarck and Fargo.

The State Emergency Operations Center (SEOC) utilizes the Incident Command System (ICS) and serves as a central location for coordinating technical and resource assistance from state, federal, private, and voluntary agencies in support of local government. WebEOC, which aids coordination and interoperability of response and recovery activities among affected jurisdictions, is used in the SEOC to report and track information in order to provide situational awareness to responding agencies and jurisdictions. In addition the SEOC uses EmerGeo, a GIS mapping software tool that

interfaces with WebEOC, to develop a common operating picture. The section maintains a 24/7 duty officer who monitors day-to-day incidents, activities and events throughout the state. The Duty Officer also serves as the primary contact for incident reporting and requests for state and federal assistance. The Duty Officer can be reached via State Radio at (701) 328-9921.

Kansas Emergency Management

The mission of the Division of Emergency Management is to provide a 24-hour operation to reduce loss of life and property, protect Kansans from all hazards by providing and coordinating resources, expertise, leadership and advocacy through a comprehensive, risk-based emergency management program of mitigation, preparedness, response and recovery.

The current Emergency Management Program in Kansas stems from two major legislative initiatives: the Federal Robert T. Stafford Disaster Relief Act, as amended, and Chapter 48, Article 9 of the Kansas Statutes Annotated. The Division of Emergency Management is the arm of the Adjutant General's Department that provides mitigation advocacy, planning requirements and guidance, response coordination, and administration of recovery programs for the civil sector of the State, regardless of the type of hazards.

The Kansas Statutes Annotated requires that each county maintain a disaster agency responsible for emergency preparedness and coordination of response to disasters. The Statutes also require each county to maintain an Emergency Operations Plan that has been approved by the Division of Emergency Management. These statutes are the basis for the State/local relationship, which is solidified by continued contacts and mutual assistance on day-to-day operations, and during times of disasters. The State and local governments work together to provide training to local emergency management and response personnel. The same is true for the conduct of periodic exercises to test the State and local emergency management systems. Kansas Emergency Management can be contacted 24 hours a day all year at 785-291-3333

South Dakota Emergency Management

The Office of Emergency Management is charged with the overall mission of protecting South Dakota's citizens and their property from the effects of natural, manmade, and technological disasters. To fulfill this mission, the Office recognizes and utilizes the four phases of emergency management:

Preparedness: Actions taken in advance of an emergency/disaster to develop operational capabilities and facilitate response operations. Such measures may include the development of plans, procedures, warning and communications systems, and mutual aid agreements and emergency public information.

Response: Actions taken during or after an emergency/disaster to save lives, minimize damages and enhance recovery operations. These measures include activation of emergency operation centers, plans, emergency communications system, public warning, mass care, shelter, search and rescue, and security measures.

Recovery: Actions taken over the short or long term to return vital life support systems to minimum standards or to return life to normal or improved levels. Such measures include damage assessment, supplemental assistance, economic impact studies, and mitigation of damage sustained.

Mitigation: Actions that can be taken to eliminate or reduce the degree of long term risk. Such measures include building codes, public education, hazard vulnerability analysis and zoning laws and resolutions.

South Dakota Emergency Management can be contacted 24 hours a day all year at 605-773-3231.

Sector Upper Mississippi River Fleet Area Management Guidelines

Environmental compliance, safety, and security are integral parts of the day-to-day operations as a standard in the river industry. Barge breakaways are an all too common event on the Western Rivers, and frequently occur in high water, high winds, or icing conditions. Breakaways pose significant safety and environmental risks, and cause economic disruption for third parties who must avoid or help retrieve adrift barges. There are numerous fleeting areas located throughout Sector Upper Mississippi River's area of responsibility on the Mississippi, Missouri, and Illinois Rivers, including approximately eighty-one (81) fleeting areas throughout the St. Louis harbor.

The purpose of this document is to reduce the frequency of barge breakaways through the incorporation of best marine practices of fleet management during extreme river conditions. It should be clear that all fleets have different dynamics that affect them. It is the responsibility of each company to know how their fleets react to these conditions, and make all reasonable efforts to maintain them accordingly. The USCG and USACE will communicate and coordinate any actions that should be implemented when river conditions change through the River Industry Advisory Committee (RIAC), Illinois River Carrier's Association (IRCA), Missouri River Action Committee (MRAC), and through radio broadcast notices to mariners.

The following best practices should be considered when operating fleets during extreme river conditions. Examples of extreme river conditions are:

- *Rapid rise or fall of the river level*
- *Heavy drift or ice flows*
- *Violent weather conditions*
- *Extreme high or low river levels*

1. Be familiar with and adhere to the St. Louis area Waterways Action Plan (WAP) and advisories. Members of the Association should make all reasonable efforts to participate in meetings/conference calls when extreme conditions are experienced.
2. Take action to minimize the effects of drift and ice accumulations on the fleets. Good communication should be made throughout the harbor, especially downriver fleets, prior to de-drifting or deicing activities.
3. Closely monitor tows transiting the harbor during extreme conditions to avoid excessive wake and/or turbulence issues.
4. Ensure crews meet at crew change to discuss the river conditions and the condition of each fleet.
5. Apply extra rigging or if necessary "narrow" the fleets.
6. Increase their fleet surveillance and mooring inspections to identify potential issues and take immediate action to correct.
7. In the event of emergency (such as a tow break-up or fleet breakaway), take immediate action to secure the breakaway; report each breakaway as soon as possible to the Captain of the Port (COTP) by telephone, radio, or other means of rapid communication.
8. For St. Louis Harbor, in the event of an emergency, the St. Louis Association should appoint one of the companies who have 24 hour dispatchers to keep the USCG Command Center apprised of the situation until the vessels involved in the emergency can talk to them directly.

Section 4 – Action Plan

The actions to be taken during High Water, Low Water and High Current conditions are described in the following Action Plan Tables. The Action Plan Tables are supplemented by Tables 1, 2 and 3. The supplemental tables provide specific Missouri River flood information and various stage and discharge information to provide a basis for use of the Action Plan Tables as well as an understanding of how the hazardous event compares historically. An Action Plan Table for Ice conditions is not provided since the Missouri River is not used by the navigation industry when ice forms, normally mid December thru mid March. In addition to the discussions on Tables 1, 2 and 3, there are discussions of Project Operations for the Missouri River Master Water Control Manual and Annual Operating Plan, and Project Operations for Buoying Recommendations for Minimum Service Flow Support.

Table 1

This table shows the US Geological Survey (USGS) historical maximum discharges from the reservoirs since the Missouri River System was fully operational in 1967. The maximum design discharge capacity of the dams as well as the USGS maximum recorded discharge near the dams is listed. In addition the USGS maximum discharge of record with the dams in place since 1967 and the USGS maximum discharge of record for the downstream gaging stations from Sioux City downstream are shown.

Table 2

This table shows the Construction Reference Plane (CRP) stages and USGS discharges for the gaging stations from Sioux City to near the mouth at St. Charles. The CRP is a design profile used for constructing and maintaining the revetment and dike system. See glossary in the main report for detailed definition of CRP. Revisions to the CRP are required to reflect periodic changes within the basin due to flood events, channel degradation and aggradations and other river related circumstances. The Kansas City District updated the CRP for the Rulo to mouth reach in 2010. Omaha District updated the CRP for Sioux City to Rulo reach in 2006. Revisions impacting this Action Plan will be reflected in future updates. The CRP provides river users an approximate baseline for full service navigation stages for the entire navigable river reach. Table 2 also shows the full service navigation discharges at the four gage locations that serve as flow targets. These targets are met by releasing appropriate flows from the reservoir system so that the discharge at each gaging station at least meets the flow target. One gaging station may just meet the target while the others may equal or exceed the target. Full service navigation discharges provides for the 9 feet deep by minimum of 300 feet wide navigation channel. Minimum service navigation discharges are also listed for the same gages. Minimum service navigation discharges provide for an 8 feet deep by minimum of 200 feet wide navigation channel. Below Kansas City there are no navigation discharge flow targets established. Tributary flows generally supplement the flows downstream below Kansas City providing the required navigation flow support. Below Kansas City the USACE, USCG and towing industry use the CRP stages as an approximation of full service navigation support as a comparison baseline. However, it must be noted that the discharges corresponding to the CRP stages are

slightly higher than the full service target discharge with the addition of normal tributary inflows from Kansas City to the mouth.

Table 3

This table shows the flood stages with discharges at the gaging stations from Sioux City to near the mouth at St. Charles. Also shown are the “extreme high water watch stages” at specific gaging stations. These watch stages are used as guidelines by the USACE in coordinated discussions with the USCG. The watch stages represent historic river levels where continuing river navigation would have impacted flood fighting activities, threatened levee integrity or caused significant infrastructure damage along the river. Because of development activity along the floodway, accretion in the floodway, and levee crest changes, these watch stages can change. However, these stages provide a reasonable reference to begin necessary actions to consider river safety zones or closings and openings. Field observations and experience will be used to update the stages.

PROJECT OPERATIONS – MISSOURI RIVER MASTER WATER CONTROL MANUAL AND ANNUAL OPERATING PLAN

Navigation support flows are initiated from Gavins Point Dam (R 811.1) on or about March 20th each year. There is about a 10 day lead time for releases from Gavins Point Dam to reach the mouth. These flows provide flow support for the calendar year navigation season, which normally runs from 1 April thru 30 November at the mouth of the Missouri River. To meet downstream flow support requirements navigation flow targets have been established at Sioux City, IA, Omaha & Nebraska City, NE and Kansas City, MO. Depending on the available system water supply these targets vary from 31,000 to 25,000 cfs at Sioux City, 31,000 to 25,000 cfs at Omaha, 37,000 to 31,000 cfs at Nebraska City and 41,000 to 35,000 cfs at Kansas City. The upper range is used when the system has normal to above normal water supply and the lower range, less 6000 cfs, is used during periods of low upstream system water supply during an extended drought. The full service flow support level refers to the upper range and the minimum service flow support refers to the lowest range. Service between full and minimum is called intermediate service. The Missouri River Water Management team runs daily Missouri River forecasts and makes daily release changes if required to meet the required flow targets during the navigation season. From early to mid-May to mid-August releases are scheduled steady to accommodate the Endangered Least Tern and Threatened Piping Plover nesting on the Missouri River. Releases are scheduled at a higher rate than required early in the nesting season to keep birds nesting high on sandbars so that the necessary amount of flow will most likely be at the navigation target later in the season when downstream tributary flows recede in July or August. From early to mid-May, releases are scheduled steady to mid-August, to accommodate the Endangered Least Tern and Threatened Piping Plover nesting on the Missouri River. Water Management will increase discharges to some higher flow, to approximate what would be generally needed to meet navigation targets during July-August. Support flows tend to be higher during mid-to-late summer, as tributary flows recede. The higher discharges in spring would spur the birds to nest higher. Then when greater support flows are needed in the summer, the higher nests should equate to reduced loss of birds. The Master Manual also provides for the

spring pulse operation designed for the endangered Pallid Sturgeon during March and May if the reservoir system storage threshold is above 36.5 million acre feet (maf) and the downstream flood thresholds are not exceeded. The season length is variable based on system water supply conditions as determined by the reservoir storage check on 1 July. The season length can be reduced no greater than two months. If an extended drought and usage of the system causes the system storage to be less than or equal to 31 million acre feet, navigation for that year will not be supported by system releases. During years of above normal water supply the season is often extended to December 10th to provide additional floodwater evacuation to prepare the system for the following runoff season prior to winter freeze in.

PROJECT OPERATIONS – BUOYING RECOMMENDATIONS FOR MINIMUM SERVICE FLOW SUPPORT

Since the reservoir system was fully operational in 1967 there have been two major droughts, 1988 -1993 and 2000 - 2007. The first drought period, 1988-1993, provided the first opportunity to understand the performance of the navigation channel design during minimum service flow support. An USACE memo to the USCG, dated February 14, 1990, recommended buoying the river to provide an 8 feet deep channel within the widths available. During the March 26, 1990 Joint USACE and USCG Meeting, it was agreed that the USCG buoy to 8 feet deep, but it was also agreed that the USCG would consider issuing a Notice to Mariners of any areas with channel dimensions that were less than 8 feet x 200 feet. If the channel conditions could only support dimensions less than 8 feet x 150 feet the USCG would consider establishing a Safety Zone for those reaches on a case by case basis. During the drought of 2000 - 2007 for minimum service flow support the same buoying and notification operations were implemented.

ACTION PLAN TABLE – High Water, Sioux City, IA to the Mouth RM 734.8 – 0.0

The Action Plan Table consists of seven tables that consider High Water for the seven reaches that divide up the navigation channel from Sioux City to the mouth. These reaches are the Sioux City Reach from river mile 734.8 to 630, the Omaha Reach from 630 to 500, the St. Joseph Reach from 500 to 400, the Kansas City Reach from river mile 400 to 300, the Brunswick Reach from river mile 300 to 200, the Jefferson Reach from river mile 200 to 100 and the Washington Reach from river mile 100 to 0.0. The tables show Trigger Readings for making decisions. These readings include flood stages and extreme high water watch stages that are also shown on Table 3.

In addition to the standard Action Plan Tables for High Water, a High Water Stage Trigger Table is provided to help simplify the comparison between discharge, stage and the action decisions.

ACTION PLAN TABLE – Low Water, Kansas City, MO to the Mouth RM 366.1 – 0.0

Low water is a significant issue for the reach from Kansas City to the mouth. River reaches upstream are supported by reservoir releases that provide the minimum required navigation flows. Low water is generally not an issue for the upstream reaches. However sometimes navigation target flows are slightly missed as a result of flow regulation for endangered species or unexpected reductions from tributary flows. Missing the target flow at the Kansas City gage or low tributary drought influenced inflows impacts the reach downstream the most. Therefore Action Plan Tables for Low Water include only the four reaches within Kansas City to the mouth. These reaches are the Kansas City Reach from river mile 366.1 to 300, the Brunswick Reach from river mile 300 to 200, the Jefferson Reach from river mile 200 to 100 and the Washington Reach from river mile 100 to 0.0. The Kansas City Reach begins at river mile 366.1 as this is the most downstream target gage location for supporting navigation flows from the reservoir system. The lowest discharge Trigger Reading indicated for the Kansas City gage for normal operations corresponds with minimum service navigation flows of 35,000 cubic feet per second (cfs). The falling water discharges at the Kansas City gage corresponds to a missed target situation. The falling water discharges downstream are a result of a missed target at Kansas City and/or drought conditions on the tributaries. Mainstem river gages that have locations that correspond to the upstream and downstream river mile positions for each river reach are used for Trigger Reading discharges.

The Action Plan Tables for Low Water include both discharge and gage information. Although discharge is what maintains the channel, stage is most often used as a river flow benchmark. For any given river discharge the stage can fluctuate due to river sediment bed forms moving downstream. The stages provided for the low water table are the best average stage for the discharges indicated.

In addition to the standard Action Plan Tables for Low Water, a Low Water Trigger Table is provided to help simplify the comparison between discharge, stage and the action decisions.

ACTION PLAN TABLE – High Current, Sioux City, IA to the Mouth RM 734.8 – 0.0

The seven tables provided consider high current using high discharges caused by basin or regional flood events for the entire navigable river reach. These reaches are the Sioux City Reach from river mile 734.8 to 630, the Omaha Reach from 630 to 500, the St. Joseph Reach from 500 to 400, the Kansas City Reach from river mile 400 to 300, the Brunswick Reach from river mile 300 to 200, the Jefferson Reach from river mile 200 to 100 and the Washington Reach from river mile 100 to 0.0. The greatest concerns for the high and very high currents are those created by flood waters carried by the river. Experience indicates that although the greatest of these flows can be navigated against it will be other factors that make the decision to issue advisories or establish safety zones or river closures.

Individual tributaries can receive significant rain events that have currents reaching the confluence of the Missouri River that penetrate well into the channel. These situations provide high current navigation challenges for tows that pass a flooding tributary confluence. However

these are infrequent and short lived events and the majority of tows safely pass on the opposite side of the river to avoid the side energy.

Dam/Reservoir	State	Maximum Discharge Of Record With Dams 1967- Present (cfs)	Maximum Design Discharge Capacity (cfs)	Maximum Discharge Of Record Near Dams (cfs)

* This Gage is not rated					
** The bridge tender for the Union Pacific RR Bridge at Atchison, KS may close the swingspan section when the Atchison river gage reaches a stage of 26 feet with a rising river predicted. The concern is drift lodging into the bull gear of the center pier preventing the closing of the bridge to railroad traffic. The bridge tender checks for any nearby towboat traffic to coordinate the closing. See contact list for bridge tender information.

*NOTE: The minimum navigation service flow target for Kansas City is 35,000 cubic feet per second. This flow is usually met throughout the navigation season. However during the nesting season for the endangered shore birds, the piping plover and the interior least tern, constant Gavins Point Dam releases are made. These flows are usually high enough to provide the necessary flow targets. Occasionally drought conditions in the lower basin cause the target to be missed. If water is available in the Kansas state reservoirs, they can be used to assist in meeting the necessary target flow at Kansas City.

**NOTE: River stages fluctuate for the same river discharge. The stages listed for the discharges shown are based on analysis of the river Stage discharge relationships during the 2007 Navigation year with updates from the 2010 CRP results.

***NOTE: Trigger Gage Readings are informational and not used as absolute decision points

		Rising	Waverly 45,000 cfs Boonville 48,000 cfs	Normal Operations		As current rises towards trigger current, consider need to initiate communications plan
		Rising	Waverly 114,000 cfs Boonville 160,000 cfs	High Current	Watch	Initiate communication plan, consider a safety advisory; Begin assessments of hazardous condition. Discuss voluntary horsepower and tow size restrictions. Cautious of accessibility terminals. Consider safety advisory for UMR fleet due to drift. Consider standing up ICP.
River Mile 300.0-200.0 BRUNSWICK REACH Missouri River Gages Waverly – RM 293.2 Boonville – RM 196.6		Rising	Waverly 167,000 cfs Boonville 214,000 cfs	Very High Current	Action	Use high current information along with extreme high water, flood fighting reports, impacted river reach, towboat positions and levee conditions to determine the need to revise the safety advisory, establish a safety zone, or river closure. Consider press release, and/or JIC, and formation of Incident Command Post if needed.
		Falling	Waverly 167,000 cfs Boonville 214,000 cfs	Very High Current	Recovery	Consider revisions to advisory on safety zone restrictions or closure. Continue to report hazardous conditions.
		Falling	Waverly 114,000 cfs Boonville 160,000 cfs	High Current	Recovery	Consider revisions to safety advisory that indicates swift currents. Report hazardous condition. Discuss voluntary horsepower and tow size restrictions.
		Falling	Waverly 45,000 cfs Boonville 48,000 cfs	Normal Operations	Recovery	Issue final advisory that indicates return to normal operations. Report any hazardous conditions to the USCG.

ACTION PLAN TABLE – HIGH CURRENT, Jefferson Reach RM 200.0 – 100.0

CRITICAL REACH DESCRIPTION	TRIGGER READING	TREND	TRIGGER CURRENT	DESCRIPTION	PHASE	ACTION
		Rising	Boonville 48,000 cfs Hermann 56,000 cfs	Normal Operations		As current rises towards trigger current, consider need to initiate communications plan
		Rising	Boonville 160,000 cfs Hermann 200,000 cfs	High Current	Watch	Initiate communication plan, consider a safety advisory; Begin assessments of hazardous condition. Discuss voluntary horsepower and tow size restrictions. Cautious of accessibility terminals. Consider safety advisory for UMR fleet due to drift. Consider standing up ICP.
River Mile 200.0-100.0 JEFFERSON REACH Missouri River Gages Boonville – RM 196.6 Hermann – RM 97.9		Rising	Boonville 214,000 cfs Hermann 255,000 cfs	Very High Current	Action	Use high current information along with extreme high water, flood fighting reports, impacted river reach, towboat positions and levee conditions to determine the need to revise the safety advisory, establish a safety zone, or river closure. Consider press release, and/or JIC, and formation of Incident Command Post if needed.
		Falling	Boonville 214,000 cfs Hermann 255,000 cfs	Very High Current	Recovery	Consider revisions to advisory on safety zone restrictions or closure. Continue to report hazardous conditions.
		Falling	Boonville 160,000 cfs Hermann 200,000 cfs	High Current	Recovery	Consider revisions to safety advisory that indicates swift currents. Report hazardous condition. Discuss voluntary horsepower and tow size restrictions.
		Falling	Boonville 48,000 cfs Hermann 56,000 cfs	Normal Operations	Recovery	Issue final advisory that indicates return to normal operations. Report any hazardous conditions to the USCG.
